(1) Since stocks represent paper to be printed in the future, the Day's Supply is calculated by dividing publishers stocks in tons by the projected consumption in the next following month.

The projected consumption is based on the assumption that the seasonal adjusted rate in the coming month will be equal to the average of the two preceding months.

(a) SOURCE: Based on data in A.P.I. Capacity Survey Issued November, 1984, plus subsequen revisions announced since that time.

(b) SOURCE: Canadian Pulp and Paper Association.

(c) In 1974 a number of newsprint producers reduced the grams per square meter (g/m^2) o newsprint from 52 to 48.8. A given area of printing surface of 48.8 g/m^2 paper weigh less than the same area of 52 g/m^2 paper. The capacity figures for 1974 have been showr on both the old and new basis to provide a continuity of data.

(d) Canadian capacity has been revised beginning with 1975 to include downtime of less tha twenty-four hours in operating hours. Previously, downtime of less than eight hours wa included in operating hours. This extra line of information provides a "bridge" betwee the old method and the new method of calculating Canadian capacity.
